

Lexar EZ vs. Resicore

With weed resistance expanding and corn commodity prices tightening input budgets, farmers are looking for products that deliver a good return on their investment. Containing atrazine, S-metolachlor and mesotrione, Lexar[®] EZ corn herbicide has three sites of action and delivers more effective weed control dollar for dollar than Resicore corn herbicide.

Comparing Effective Sites of Action

Lexar EZ

Active ingredients:

Mesotrione
(HPPD Inhibitor,
Site Of Action Group 27)

Atrazine
(PSII Inhibitor,
Site Of Action Group 5)

S-metolachlor
(VLCFA Inhibitor,
Site Of Action Group 15)

Resicore

Active ingredients:

Mesotrione
(HPPD Inhibitor,
Site Of Action Group 27)

Clopyralid (Stinger[®])
(Plant Growth Regulator,
Site Of Action Group 4)

Acetochlor
(VLCFA Inhibitor,
Site Of Action Group 15)

Resicore has three sites of action (groups 4, 15 and 27) but only **two** are effective at providing residual control because one of its active ingredients, clopyralid (Stinger), is not a lethal dose rate. Lexar EZ contains **three** effective sites of action (groups 5, 15 and 27).

- Fields are **83 times less likely to develop weed resistance if they receive more than 2.5 effective sites of action** per herbicide application¹
- Lexar EZ manages broadleaf weed biotypes resistant to ALS-inhibiting, glyphosate and PPO herbicides
 - Proactive resistance management **increases estimated grower profits by 14-17.5%** over a 20-year planning horizon²
 - Managing resistance pays for itself quickly, within 2-3 years²

73 Days After Treatment

Resicore 3.0 qt/A PRE

Lexar EZ 3.5 qt/A PRE

2016 Syngenta trial HBI004: Gilbert, IA

Residual Control Comparison

Trial Information:

Trial locations: IA, IL, MO, IN.

Plot Size: Minimum 10 ft x 30 ft.

Replications: 3

Application Rates and Timing: Lexar EZ 3-3.5 qt/A and Resicore 2.5-3 qt/A as preemergence application.

DAT: Days after treatment,
N= Number of trials.

Data from 6 Syngenta and university-replicated trials in 2016 (applied preemergence)
